

Stakeholders and Gaps

Hunter Harris, Alayna Felder-Fields, Grayson Lessard, Aidan Feess

1. Requirements

- a. Users add games to a shared per-server wishlist through Discord bot commands
- b. The bot checks prices/discounts on Steam, Epic Games, etc.
- c. The bot posts a daily deal digest to the server
- d. The bot flags deals multiple people wishlisted
- e. The system checks prices on a recurring schedule

2. Who has a stake

- a. API providers (Steam, Epic Games, etc.): want the bot to stay within their rate limits and terms of service
- b. Discord: wants the bot to follow its bot policies and not spam servers
- c. Dr. Bowman: wants a working, well-scoped project delivered across the three sprints
- d. Server admins: want control over whether the bot is installed, which channel it posts in, and the ability to remove it

3. What is missing

- a. Security - how bot tokens and API keys are stored; whether a user's Discord ID or wishlist is exposed to anyone else
- b. Data retention - how long wishlist and price history persist, and what happens to a user's data when they leave a server
- c. Reliability - what happens if the bot crashes or loses its database connection
- d. Performance: how long a full price check is allowed to take before the daily digest is late
- e. Scalability: whether the design only works for one friend group or holds up across many servers

4. What could it cost

- a. Time
- b. Security - a leaked bot token or API key means resetting credentials everywhere and possibly getting banned by a store; this is the hardest to undo
- c. Performance - if checking every wishlist is too slow, the architecture would have to be rebuilt instead of patching it
- d. Potential features if we mess up on things early and find out late
- e. Reliability - if error handling fails during the demo, the core feature breaks in front of the grader, and fixing it late means reworking what the project was pitched on

5. Who will you not ask

- a. **Server members who never use the wishlist.** The bot posts in their channel every day, but we only consult the people who add games. Risk: they find the daily posts annoying, complain to an admin, and the bot gets muted or removed.
- b. **Store/API providers (Steam, Epic Games, etc.).** We won't ask them because we're only using their public data and don't have time in three sprints. Risk: they could ban our API key or block the bot.
